

Discussion Notes – S2S,S2D,Climate session 19 Nov 15:00 UTC

Nickitas Georgas:

Take into account all uncertainties into the validation of the climate data.
Convey the idea that scientific knowledge is increasing to their customers.
Don't use the ensemble mean, it underestimates the risk and will cause financial losses.

Joshua French:

All data characteristics could be looked at as well as other variables.

Nathan Lenssen:

What about using persistence as a reference instead of climatology or a simple statistical model as the one presented.

Dominik Büeler:

European and Scandinavian blocking behave differently in terms of biases and calibration compared to the other five regimes.

Andreas Paxian:

Forcings are the same in projections and predictions, and the projections are used as a reference.
Decadal predictions have negative skill over the tropical Pacific.

General:

Barbara finds maps very informative in spite of the problem of the dependency of the results in neighbouring plots, which leads to a false discovery.
